Executive Summary

This report analyzes 31,047 order records placed with Vrinda Store during 2022 across seven online sales channels — Amazon, Flipkart, Myntra, Ajio, Nalli, Meesho, and others. The raw export was cleaned and enriched with derived time and demographic fields, then summarized into a pivot-chart dashboard covering monthly sales trends, gender-based revenue, category performance, channel performance, order fulfillment health, and regional distribution. Total recorded revenue across all orders was **Rs. 21,176,377**, with an average order value of **Rs. 682**.

The analysis finds that demand is concentrated in a small number of categories and channels, that women's wear substantially outperforms menswear in revenue contribution, and that order fulfillment is healthy but has a measurable cancellation/return/refund rate worth monitoring going forward.

Problem Statement

Vrinda Store had no consolidated view of its 2022 sales performance — order data existed only as a flat transaction log, with no time grouping, no demographic segmentation, and no dashboard to support decision-making. This left four core business questions unanswered:

- How does demand move through the year, and where are the peak and slump months?
- Who is actually buying — which gender, age group, and geography drives the most revenue?
- Which products and channels carry the business, and which underperform?
- How healthy is order fulfillment — what share of orders are cancelled, returned, or refunded?

This project addresses that gap by cleaning the data, engineering the needed fields, and producing the visual dashboard and findings presented below.

Methodology

1. **Data cleaning (Excel Power Query):** validated 31,047 rows across 19 columns for missing or inconsistent values (none found), then engineered a *Month* field from the order date and an *Age Group* field (Teenager / Adult / Senior) from customer age.
2. **Dashboard build (Excel):** constructed pivot tables for monthly orders/sales and gender-based revenue, visualized with native bar and pie charts on a dedicated report sheet.
3. **Chart production:** category, channel, order-status, and state-level breakdowns were charted from the cleaned dataset to round out the views already built into the Excel dashboard.

Findings

1. Monthly Orders vs Sales

Revenue peaked in March (Rs. 1.93M) and declined through the year, bottoming in November (Rs. 1.62M) — a ~16% drop from peak to trough, despite order volume staying comparatively stable.

2. Revenue Share by Gender

Women's wear generated 64.2% of total revenue (Rs. 13.6M) versus 35.8% for menswear (Rs. 7.6M).

3. Revenue by Product Category

Sets (49.6%) and Kurtas (23.4%) together account for roughly 73% of total revenue, making them the core inventory categories.

4. Revenue by Sales Channel

Amazon leads with 11,016 orders, well ahead of Myntra (7,254) and Flipkart (6,703); the remaining four channels together contribute a smaller share of volume.

5. Order Status Breakdown

92.3% of orders were delivered successfully. Returns (3.4%), cancellations (2.7%), and refunds (1.7%) together account for 7.7% of order volume.

6. Top 10 States by Revenue

Maharashtra, Karnataka, and Uttar Pradesh are the top three revenue-generating states, together accounting for a meaningful share of national demand.

Recommendations

- **Protect stock on Sets and Kurtas** — these two categories drive ~73% of revenue; stockouts here carry the highest opportunity cost.
- **Invest further in women's assortment and marketing**, given its ~64% share of revenue, while evaluating whether the menswear range needs repositioning or promotion to close the gap.
- **Prioritize Amazon and Myntra** in channel-level promotions and negotiations, as they jointly drive the majority of order volume.
- **Investigate the March-to-November revenue decline** — determine whether it reflects seasonality, competitor activity, or reduced marketing spend, and plan Q4 campaigns accordingly.
- **Monitor the 7.7% cancellation/return/refund rate** as a standing KPI, and drill into SKU- or size-level return reasons to reduce avoidable reverse logistics costs.
- **Double down on top-performing states** (Maharashtra, Karnataka, Uttar Pradesh) with localized inventory placement or regional marketing while testing growth plays in lower-performing states.

Conclusion

Consolidating Vrinda Store's 2022 order data into a cleaned, structured dataset with a supporting dashboard turns a flat transaction log into a decision-ready view of the business. The findings above give management a concrete starting point for inventory, marketing, and channel strategy heading into the next fiscal year. The underlying cleaned dataset, dashboard, and source code accompanying this report are available in the linked GitHub repository.
